Professional Summary

Computer Science undergraduate focused on Product Management and AI Product Management, with hands-on experience in product discovery, user research, competitive analysis, requirements definition, PRDs, user stories, feature prioritization, and AI workflow design. Experienced in translating ambiguous user and operational problems into structured product requirements and working across product and engineering workflows to define, prototype, and validate solutions.

Skills

Product Management: Product Discovery, User Research, Product Requirements (PRDs), User Stories, Acceptance Criteria, MVP Definition, Feature Prioritization, User Journey Mapping, Workflow Design, Wireframing, Product Documentation

AI Product Management: AI Product Discovery, LLM Workflow Design, Prompt Engineering, AI Feature Design, Human-in-the-Loop Systems

Product Analysis: Competitive Analysis, Market Research, Problem Framing, Requirements Analysis, Product Metrics, Hypothesis Validation, Validation Experiments, User Feedback Analysis

Programming: Python, JavaScript, SQL

Frameworks & Technologies: React.js, Django, Django REST Framework, FastAPI, REST APIs, HTML5, CSS3

Databases: PostgreSQL, MySQL

Tools: Jira, Figma, Git, GitHub, Postman, VS Code, ChatGPT, Claude, GitHub Copilot, Cursor

Product & Project Experience

AI Operations Copilot

AI Product & Workflow Design

- Conducted problem discovery by synthesizing user feedback, community discussions, competitor research, websites, and secondary research to understand operational pain points in residential communities.
- Mapped existing solutions against user needs and identified gaps in how community secretaries and operations coordinators manage repetitive coordination work.
- Reframed the product opportunity around reducing coordination overhead while preserving existing resident and vendor workflows and avoiding the need for users to adopt another application.
- Designed and prototyped an AI Operations Copilot that works alongside existing community conversations to classify new issues, duplicates, status checks, reopened issues, and irrelevant messages, converting unstructured conversations into structured operational workflows.
- Authored the PRD covering user personas, user journeys, product requirements, user stories, acceptance criteria, MVP scope, AI workflows, human-in-the-loop decision making, failure modes, success metrics, validation experiments, and go-to-market planning.

MEDI-LIN-Q | Healthcare Management Platform

React.js, Django REST Framework, PostgreSQL

- Consulted doctors and patients to identify pain points in medical record management, appointment scheduling, and hospital coordination, translating user needs into product requirements for a centralized healthcare platform.
- Conducted product discovery and competitive analysis to define the product vision and MVP; prioritized a universal patient ID, centralized medical records, appointment booking, and role-based workflows based on user needs, product value, and implementation feasibility.
- Co-led product planning by defining user journeys, functional requirements, MVP scope, and application workflows across patient, doctor, hospital, and public-user journeys; translated product requirements into implementation-ready specifications and coordinated module ownership across frontend and backend teams.
- Independently designed and developed the Hospital Management backend using Django REST Framework, implementing REST APIs, backend workflows, and database integration; validated end-to-end workflows and resolved backend integration issues.
- Presented product decisions, technical architecture, implementation approach, and business value to faculty and project stakeholders as the team's primary presenter.

Research

Graph Neural Networks for Geopolitical Shocks in Global Supply Chains

Co-author

- Co-authored a research paper proposing a Stochastic Graph Neural Network framework integrating Bayesian inference, Structural Causal Models, and Variational Autoencoders.
- Reviewed and synthesized insights from 30+ research papers to identify research gaps across graph learning, causal inference, and uncertainty-aware machine learning.
- Published the work as a ResearchGate preprint and submitted it to ACDSA 2027, an IEEE-sponsored conference.

Education

B.E. in Computer Science & Engineering, BMS Institute of Technology & Management

8.90 CGPA | Expected 2027

12th | Expert PU College

94.67% | 2023

10th | Kenbridge School, Gulbarga

94.8% | 2021

Certifications
