

# C SHREYA

Bengaluru | +91 8618109502 | chittawadagishreya2006@gmail.com | LinkedIn | GitHub

## Education

**B.E. in Computer Science & Engineering, BMSIT&M**  
12th, Expert PU College  
10th, Kenbridge School, Gulbarga

**CGPA: 8.90** | Expected 2027  
**94.67%** | 2023  
**94.8%** | 2021

## Skills

**Product:** Product Discovery, User Research, Problem Framing, PRDs, MVP Definition, Feature Prioritization, User Journeys, Workflow Design, User Stories, Acceptance Criteria

**Analytics & AI:** SQL, Data Analysis, Product Metrics, Hypothesis Validation, User Feedback Analysis, Competitive Analysis, LLM Workflow Design, AI Agents, AI Feature Design, Prompt Engineering, Human-in-the-Loop Systems

**Technical:** Python, JavaScript, PostgreSQL, MySQL, React.js, Django, Django REST Framework, FastAPI, REST APIs, Git, GitHub, Figma, Jira, Postman

## Product & Project Experience

### AI Operations Copilot

*AI Product & Workflow Design*

- Conducted product discovery through user feedback, community discussions, competitor research, websites, and secondary research to identify repetitive operational pain points and unmet needs in residential communities.
- Synthesized findings to identify gaps in existing solutions and reframed the opportunity around reducing coordination overhead without requiring users to adopt a separate application.
- Designed and prototyped an AI Operations Copilot that analyzes unstructured community conversations and classifies new issues, duplicates, status checks, reopened issues, and irrelevant messages into structured operational workflows.
- Designed AI workflow logic, edge cases, failure modes, and human-in-the-loop decision points for ambiguous or high-risk classifications.
- Defined success metrics balancing automation quality, operational reliability, and user control, including intervention points for uncertain cases.
- Authored the PRD covering personas, user journeys, user stories, acceptance criteria, MVP scope, feature prioritization, AI workflows, validation experiments, and go-to-market considerations.

### Travel Activities Platform - Personalization Redesign

- Framed intent ambiguity as the core product problem in travel-activity discovery, where browsing, planning, and immediate travelers can exhibit similar initial signals; designed one adaptive experience instead of forcing upfront persona selection.
- Developed a 5-tier signal framework spanning contextual, partner profile, partner journey, cross-partner, and active behavioral signals while accounting for data availability and integration boundaries.
- Designed a rules-based confidence engine across Unsure, Leaning, Committed, and Immediate states, with a Contradiction path that reduces confidence when new evidence conflicts with the current interpretation.
- Designed a two-stage multi-supplier ranking model prioritizing destination, theme, date, proximity, travel time, and time-window fit before using supplier reliability, content quality, price/value, and commercial terms as tie-breakers.
- Defined qualified availability-check rate as the primary metric with booking, trust, quality, recommendation-diversity, cancellation, supplier reliability, and fallback guardrails; established a ship/no-ship experiment rule.
- Scoped V1/V2 based on data and infrastructure prerequisites and built an interactive prototype covering adaptive states, cold start, location denial, contradictory signals, and sparse inventory.

### MEDI-LIN-Q

*Healthcare Management Platform*

- Engaged with and interviewed doctors, patients, and hospital stakeholders to identify pain points in medical record management, appointment scheduling, and hospital coordination, translating findings into product requirements.
- Conducted product discovery and competitive analysis to define the MVP and prioritize a universal patient ID, centralized records, appointment booking, and role-based workflows based on user value and implementation feasibility.
- Defined user journeys, functional requirements, MVP scope, and workflows across patient, doctor, hospital, and public-user journeys; translated requirements into implementation-ready specifications.
- Independently designed and developed the Hospital Management backend using Django REST Framework, implementing REST APIs, backend workflows, and PostgreSQL integration.
- Validated end-to-end workflows, resolved frontend-backend integration issues, and implemented role-based authentication and permission controls.

## Research

### Graph Neural Networks for Geopolitical Shocks in Global Supply Chains

*Co-author*

- Co-authored a research paper proposing a Stochastic Graph Neural Network framework integrating Bayesian inference, Structural Causal Models, and Variational Autoencoders.
- Reviewed and synthesized 30+ research papers across graph learning, causal inference, uncertainty-aware ML, and generative modeling; published the work as a ResearchGate preprint and submitted it to ACDSA 2027, an IEEE-sponsored conference.

## Certifications

**Leadership & Team Effectiveness | NPTEL** — Top 5%, 2025

**Overview of Agile & DevOps | Infosys Springboard** — 2025
